DEVELOP A SIMPLE CALCULATOR USING XML - RPC

Aim: To develop a simple calculator application using the XML-RPC protocol in Python that performs arithmetic operations through client-server communications.

Code: Server - side code.

```
from xmlrpc.server import SimpleXMLRPCServer

class Calculator:
    def add(self, x, y):
        return x + y
    def subtract(self, x, y):
        return x - y
    def multiply(self, x, y):
        return x * y
    def divide(self, x, y):
        if y != 0:
            return x / y
```

code: Client-side code (client.py)

```
import xmlrpc.client
Proxy = xmlrpc.client.ServerProxy.
Print ("Addition: 10+5=", Proxy.add(10,5))
Print ("Subtraction: 10-5=", Proxy.subtract(10,5))
Print ("Division: 10/5 =", Proxy.divide(10,5))
```

Procedure:

1. Open a Python IDE or terminal
2. Create 2 separate Python file: Server.py & client.py.
3. Run the server.py and client.py
4. Observe the result displayed on the client screen & verify the server output.

Result:

The XML-RPC based calculator was successfully implemented. The client interacted with the server.
