# DEVELOP A PROGRAM TO CREATE REVERSE SHELL USING TCP SOCKETS

Aim:
The aim of this exercise is to understand and implemented a reverse shell using TCP sockets.

Procedure
* Create a new python script on the attacker machine.
* Copy the server-side code.

code: client.py

```
import socket
client_socket = socket.socket(socke
                AF_INET, SOCKET.SOC
                -STREAM().

server_ip = "127.0.0.1".
server_port = 9999
client_socket.connect((serv_ip,
                serv_port))

while True:
    message = input("client:")
    socket.send(messag
```

```
if message.lower() == 'bye':
    Print("chat ended")
    break
reply = Client_socket.recv(1024)
if reply.lower() == "bye":
    Print("Server ended the chat")
    break
Client_Socket.close()
```

Code: server.py (on the attacker machine)

```
import Socket.
    Server_Socket = Socket.socket(
                    SOCKET:AF_INET,
                    Socket.SOCK_STREAM
host = "127.0.0.1"
Port = 9999.
server_socket.bind((host, Port))
Server_Socket.listen(5)
Print("waiting for a client to
                connect...").
Print("client connected", client_
                address).
```

```
while True:
    message = client_socket.recv(1024).decode()
    if not message.lower() == 'bye':
        print("Client ended the chat").
        break
client_socket.close()
server_socket.close()
print("Server stopped").
```

Result:

A TCP client-server program was successfully created using Python's socket module to establish two way connection & exchang
